TITLE: Write a Java program to perform reading from and writing to a file using file handling operations.

Write a Java program to perform reading from and writing to a file using file handling operations.

To perform file reading and writing operations using Java file handling classes.

Java provides file handling through the `java.io` package. Classes such as `File`, `FileReader`, `FileWriter`, `BufferedReader`, and `BufferedWriter` are used to perform input and output operations. File handling enables permanent storage and retrieval of application data. Proper exception handling is necessary to manage file-related errors. These concepts are essential for data persistence.

1. Create a program to write and read employee details from a file.

```
public class EmployeeFile {  
    public static void main(String[] args) {
```

```
try {  
    // Writing to file  
    FileWriter fw = new FileWriter("employee.txt");  
  
    fw.write("Employee ID : 102\n");  
    fw.write("Name      : Daksh Jain\n");  
    fw.write("Department : Human Resources\n");  
    fw.write("Salary    : 55000\n");  
  
    fw.close();  
  
    System.out.println("Employee details written successfully.\n");  
  
    // Reading from file  
    FileReader fr = new FileReader("employee.txt");  
    BufferedReader br = new BufferedReader(fr);  
  
    String line;  
  
    System.out.println("Employee Details:");  
  
    while ((line = br.readLine()) != null) {  
        System.out.println(line);  
    }  
  
    br.close();  
  
} catch (IOException e) {  
    System.out.println("Error: " + e.getMessage());  
}
```

```
}  
}
```

OUTPUT:

```
Employee details written successfully.  
  
Employee Details:  
Employee ID : 102  
Name       : Daksh Jain  
Department  : Human Resources  
Salary      : 55000  
  
[Done] exited with code=0 in 1.411 seconds
```

2. Create a Java program to write patient details (patient ID, name, age, and diagnosis) to a file and read the details from the file for display.

```
import java.io.*;
```

```
public class PatientFile {
```

```
    public static void main(String[] args) {
```

```
        try {
```

```
            FileWriter writer = new FileWriter("patient.txt");
```

```
            writer.write("Patient ID : 305\n");
```

```
            writer.write("Name : Sneha Verma\n");
```

```
            writer.write("Age : 28\n");
```

```
            writer.write("Diagnosis : Migraine\n");
```

```
            writer.close();
```

```
            System.out.println("Data written successfully.\n");
```

```
BufferedReader reader = new BufferedReader(new FileReader("patient.txt"));

String line;

System.out.println("Patient Details:");

while ((line = reader.readLine()) != null) {
    System.out.println(line);
}

reader.close();

} catch (IOException e) {
    System.out.println(e);
}
}
```

OUTPUT:

```
Data written successfully.

Patient Details:
Patient ID : 305
Name : Sneha Verma
Age : 28
Diagnosis : Migraine

[Done] exited with code=0 in 1.328 seconds
```
